1. Welcome to Eshhan

Eshhan is your everyday companion for driving an electric car in Jordan. It finds fast-charging stations near you, tells you the exact price to charge at the current hour, plans longer trips around charging, and keeps a record of what you've spent. It works in Arabic and English and installs on your phone like a native app.

What you can do

- Find & search every public charging station in Jordan on a live map.
- See the live electricity price from Jordan's time-of-use tariff.
- Calculate exactly what a charge costs — at a station or at home.
- Plan a trip with suggested charging stops, cost and time.
- Keep a garage of your cars and a history of your sessions.
- Save favourites, report faulty stations, and share locations.

2. Getting started

Create your account

Sign up with your Jordanian mobile number and a password — no email needed. Enter your name, number (07XXXXXXXX) and a password, then confirm the code.

First-time setup

- Allow location so the app shows the nearest stations and accurate distances.
- Add your vehicle — make, model, battery size and year.
- Confirm your details — your name and city.

Tip: The app knows every EV sold in Jordan (185+ variants). If yours isn't listed, choose "Other / Not Listed" and enter the battery size, consumption and max charging rate manually.

3. The home screen

Your dashboard the moment you open the app.

Current tariff card

The large card shows the live price per kWh at a fast station, coloured by the current period — green off-peak, amber partial-peak, red peak. A 24-hour strip marks “now”, and the price updates automatically as the hour changes.

At a glance

- Live date & time in the corner.
- Nearby stations within 10 km, and the recommended station that fits your car.
- Fastest suitable option — one tap to navigate to the nearest compatible fast charger.
- Quick actions to the map, calculator, trip planner and history.

4. Charging stations map

Finding a station

An interactive map of Jordan's network, centred on you.

- Search by station name, operator or area.
- Filters: connector, power (50/100/150 kW+), operator, status.
- Favourites — star stations and filter to them.
- My location re-centres the map on you.
- Range ring — enter your battery % to see how far you can really reach.

Station details

Tap any pin for its card: photo, operator, address, status, power, points, and every connector. From there you can:

- Navigate (Google Maps directions) or View on map.
- Share the station or copy its coordinates.
- Report an issue if it didn't work — it reaches the team.
- Star it to save to favourites.

5. My Garage

Keep one or more vehicles; every calculation is tailored to the car you select.

Adding a vehicle

Choose make → model → battery → year. The card shows battery capacity, range, max DC rate, consumption and connector. Set a default, add a nickname, or remove it anytime.

Home charger setup

For home charging, set your meter type (dedicated EV or services meter), charger power (2.3–11 kW) and tariff tier once — so home costs match your bill.

6. Charging cost calculator

Know the cost before you plug in — the app's signature feature.

- Choose fast station or home.
- Set current and target battery %, and the start time.
- It picks the right tariff for the location, meter and time period.

Results

- Energy added and charge duration.
- Total cost in JOD and cost per km of range.
- A breakdown by period when a charge crosses tariff windows.
- A monthly comparison of home vs station vs petrol cost.

7. Trip planner

Plan a drive between any two Jordanian cities with charging in mind.

- Pick origin & destination, your battery %, and toggle climate load (+15% for AC/heating).
- It estimates route distance and the energy your car needs.
- If you can't make it, it suggests fast-charging stops — each with detour, kWh, time and cost.
- A summary shows your battery % at every waypoint.

8. My Charging — history & sessions

Tap the central charging button in the bottom bar to open your hub.

History

- Every session saved with date, place, energy and cost in JOD.
- Monthly and yearly totals to track your spending.

New session

Record a charge in seconds: pick the vehicle, station or home, and the energy delivered — the app prices it with the correct time-of-use tariff.

9. Alerts

Time-aware reminders — e.g. off-peak (the cheapest window for home charging) starts at 05:00, or a heads-up when you're in the peak period so you can wait and save. Open them from the bell icon at the top.

10. Profile & settings

Edit your details — name and city.

- Language — switch Arabic / English instantly.
- Appearance — light or dark mode (dark also dims the map).
- About — version, data sources and tariff notes.
- Sign out, or permanently delete your account and data.

11. Admin panel

Admins get an extra panel from Profile with three tabs:

- Users — every registered user with phone, city, sign-up date and activity.
- Stations — add a station missing from the automatic sources: name + location (coordinates or a Google Maps link), an optional photo, and the connector. It appears on everyone's map instantly.
- Reports — the “didn't work” reports from users, to resolve or remove.

This panel is only visible to the app administrator.

12. Install as an app

Eshhan installs to your home screen and runs full-screen like a native app.

On iPhone (Safari)

- Open eshhan.jo in Safari.
- Tap Share, then Add to Home Screen.
- The Eshhan icon appears on your home screen.

On Android (Chrome)

- Open the site in Chrome.
- Tap the menu button (three dots), then Install app.

13. Time-of-use tariff reference

Jordan prices EV charging by time of day. All values in JOD per kWh.

Time periods

- Off-peak: 05:00 – 14:00
- Partial-peak: 14:00 – 17:00 and 23:00 – 05:00
- Peak: 17:00 – 23:00

Public fast stations	JOD / kWh
Off-peak	0.183
Partial-peak	0.193
Peak	0.213

Home — dedicated EV meter	JOD / kWh
Off-peak	0.108
Partial-peak	0.118
Peak	0.160

Home — services meter (tiered)	JOD / kWh
Tier 1	0.050
Tier 2	0.100
Tier 3	0.200

These are the published time-of-use rates used by the app. Rates can change — always confirm the current price with your operator or electricity provider.

14. Tips & FAQ

Which connector does my car use?

The app knows: European models use CCS2, most China-market models use GB/T DC, older Nissan/Kia use CHAdeMO. It only routes you to matching stations.

Why is the range lower than the brochure?

China-market range figures (CLTC/NEDC) are optimistic. The calculator uses real consumption, so its results are closer to reality.

Is my data safe?

Your password is stored encrypted and never shared. You can delete your account and all its data anytime from Profile.

A station is wrong or missing?

Use Report an issue on the station card. Data comes from OpenChargeMap and OpenStreetMap plus manual additions, refreshed daily.
